The number may vary depending on the service and depends on the availability of their data. The number will be updated daily once available. Altmetric calculates the result based on the network attention the article receives. Each colored thread in a circle represents a different kind of online attention. The number in the middle is the Altmetric score. Social media and mainstream media are the main sources calculating the result. Reference managers such as Mendeley are also monitored but do not contribute to the result. Older articles often score higher because they had more time to notice them. To explain this, Altmetric included context data for other articles of a similar age. Age.
